Bottleless Cooler Rough In Specs:

All our water coolers are Energy Star approved.

Power requirements are standard 110volt.

The Hot/Cold unit draws less than 5 amps

The Cold/Cold unit draws less than 3 amps.

Coolers are UL approved.

- The water line requirements are similar to standard ice makers.
- No drain is necessary.
- 1/4" OD (outside diameter) tubing should be used. While copper can be used to run the water line to location, food grade plastic tubing should be used to connect to the cooler. This prevents kinks from developing as a result of the disconnecting and reconnecting movement associated with annual filter changes.
- A shutoff valve should be located nearby.
- The connectors on the cooler and filters are John Guest EZ on connectors so no fittings or ferules are needed.
- The connection point on the cooler is 45-50" off the floor. Some additional slack is helpful.
